and R<sup>6</sup> are identical and are each hydrogen, C<sub>1</sub>-C<sub>4</sub>-alkyl, C<sub>1</sub>-C<sub>4</sub>-alkoxy or C<sub>1</sub>-C<sub>4</sub>-alkoxy-C<sub>1</sub>-C<sub>4</sub>-alkyl, or R<sup>5</sup> and R<sup>6</sup> together denote -(CH<sub>2</sub>)<sub>4</sub>- or -O(CH<sub>2</sub>)<sub>2</sub>O-, in free or salt or solvate form. In such compounds, the carbon atom in formula I marked with an asterisk \* preferably has the R configuration. Specific especially preferred compounds are those described in the Examples hereinafter.

The compounds of formula (I) are capable of forming acid addition salts, particularly pharmaceutically acceptable acid addition salts. Pharmaceutically acceptable acid addition salts of the compound of formula I include those of inorganic acids, for example, hydrohalic acids such as hydrofluoric acid, hydrochloric acid, hydrobromic acid or hydroiodic acid, nitric acid, sulfuric acid, phosphoric acid; and organic acids such as formic acid, acetic acid, propionic acid, butyric acid, benzoic acid, o-hydroxybenzoic acid, p-hydroxybenzoic acid, p-chlorobenzoic acid, diphenylacetic acid, triphenylacetic acid, 1-hydroxynaphthalene-2-carboxylic acid, 3-hydroxynaphthalene-2-carboxylic acid, aliphatic hydroxy acids such as lactic acid, citric acid, tartaric acid or malic acid, dicarboxylic acids such as fumaric acid, maleic acid or succinic acid, and sulfonic acids such as methanesulfonic acid or benzenesulfonic acid. These salts may be prepared from compounds of formula I by known salt-forming procedures.

Suitable solvates are pharmaceutically acceptable solvates, preferably hydrates.

The present invention also provides a process for the preparation of compounds of formula I in free or salt or solvate form. They can be prepared by a process comprising:

(a) for the preparation of a compound where R<sup>1</sup> is hydroxy, either

(i) reacting a compound of formula

with a compound of formula

XVII

where Ar<sup>1</sup> is Ar as hereinbefore defined or a protected form thereof, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup> and n are as hereinbefore defined and R<sup>32</sup> is hydrogen, or an amine-protective group, or

(ii) reducing a compound of formula

XVIII

where Ar<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup> and R<sup>7</sup> are as hereinbefore defined, to convert the indicated keto group into -CH(OH)-; or

(b) for the preparation of a compound where R<sup>1</sup> is hydrogen, reducing a corresponding compound of formula I where R<sup>1</sup> is hydroxy; or

(c) for the preparation of a compound of formula I where R<sup>1</sup> is alkoxy, either (i) O-alkylating a corresponding compound of formula I where R<sup>1</sup> is hydroxy or (ii) reacting a corresponding compound having a leaving moiety instead of R<sup>1</sup> with an alcohol of formula R<sup>1</sup>H where R<sup>1</sup> is alkoxy;

and, optionally, converting a resultant compound of formula I in protected form into a corresponding compound in unprotected form;

and recovering the resultant compound of formula I in free or salt or solvate form.

Process variant (a)(i) may be carried out using known procedures for epoxide-amine reactions. It is conveniently carried out without a solvent or in an inert solvent, for example

a hydrocarbon such as toluene or an alcohol such as n-butanol. The reaction temperature is conveniently from 25°C to 200°C, preferably from 80°C to 150°C. The temperature may be achieved by conventional heating or by microwave irradiation.

Process variant (a)(ii) may be carried out using conventional methods, for example by reaction with sodium borohydride under conventional conditions.

Process variant (b) may be carried out using known procedures for reduction of secondary alcohols to hydrocarbons. Process variant (c)(i) may be carried out using known procedures for O-alkylation, for example by reaction with an alkylating agent such as an alkyl halide under known conditions. Process variant (c)(ii) may be effected using known procedures for benzylic displacement reactions, the leaving moiety being e.g. tosylate, mesylate, halogen or hydroxy.

Compounds of formula I in free form may be converted into salt or solvate forms, and vice versa, in a conventional manner.

Compounds of the invention can be recovered from the reaction mixture and purified in a conventional manner. Isomers, such as enantiomers, may be obtained in a conventional manner, e.g. by fractional crystallization or asymmetric synthesis from corresponding asymmetrically substituted, e.g. optically active, starting materials.

Compounds of formula XVI are known compounds or can be prepared by processes analogous to those used for the preparation of the known compounds, for example the procedures described in Journal of Medicinal Chemistry 1987, 30, 1563-1566. Compounds of formula XVI in which the carbon atom indicated by the asterisk \* is chiral may be prepared from a compound of formula

where Ar<sup>1</sup> and R<sup>2</sup> are as hereinbefore defined and L is a leaving atom or group, as described in WO95/25104.

Compounds of formula XVI may alternatively be prepared by epoxidation of a compound of formula

where  $\text{Ar}^1$  and  $\text{R}^2$  are as hereinbefore defined, using conventional procedures, such as those used in the Examples hereinafter.

Compounds of formula XX are known or may be prepared by methods analogous to those used for the preparation of known compounds, for example those used in the Examples hereinafter.

Compounds of formula XVII are known or may be prepared by methods analogous to those used for the preparation of the known compounds.  $\text{R}^{32}$  as an amine-protective group in formula XVII may be a known such group, for example as described in Protective Groups in Organic Synthesis, T.W.Greene, P.G.M. Wuts, John Wiley & Sons Inc, Second Edition, 1991, preferably benzyl or trifluoroacetyl.

For example, compounds of formula XVII, where  $\text{R}^3$  is hydrogen, may be prepared by reducing an oxime of formula

where  $\text{R}^4$ ,  $\text{R}^5$ ,  $\text{R}^6$ ,  $\text{R}^7$  and  $n$  are as hereinbefore defined. The reduction may be carried out by conventional methods for reducing oximes to amines. For example, the reduction may be carried out by catalytic hydrogenation, preferably using palladium on charcoal as the catalyst. The hydrogenation may be effected using known procedures, for example as described by R.D. Sindelar et al, J. Med. Chem. (1982), 25(7), 858-864. Oximes of formula XXI may be prepared as described by Sindelar et al, op.cit., or by analogous procedures.

Compounds of formula XVII where  $\text{R}^4$  and  $\text{R}^7$  are hydrogen can be prepared by reacting a compound of formula

with a compound of formula

where  $\text{R}^3$ ,  $\text{R}^5$ ,  $\text{R}^6$ ,  $\text{R}^{32}$  and  $n$  are as hereinbefore defined. The reaction may be carried out in the presence of a catalyst such as tris(triphenylphosphine)rhodium chloride. The reaction temperature may be, for example, from 60 to 120°C. The reaction is conveniently carried out in an inert solvent, for example ethanol, when the reaction temperature is conveniently about the reflux temperature of the solvent. The reaction may be carried out using known procedures, for example as described in WO96/23760. Where  $\text{R}^5$  and  $\text{R}^6$  are trialkylsilyl, the reaction between the compounds of formulae XXII and XXIII may be carried out in the presence of a metal carbonyl complex catalyst, for example using the procedure described by K.P.C. Vollhardt and R. Hillard, J.Am.Chem. Soc. 1977, 99(12), 4058, or an analogous procedure. Compounds of formula XXII may be prepared as described in WO96/23760 or by analogous procedures. Compounds of formula XXIII are known or may be prepared by known procedures.

Compounds of formula XVII where  $\text{R}^3$  is alkyl, particularly methyl, and  $n$  is 1 may be prepared by amination of the corresponding 2-alkyl-indan-1-one using ammonia and  $\text{K}_3\text{FeCN}_6$ , e.g. by the procedure of Fornum and Carlson, Synthesis 1972, 191.

Compounds of formula XVII as hereinbefore defined where  $\text{R}^4$ ,  $\text{R}^5$ ,  $\text{R}^6$  and  $\text{R}^7$  are such that the benzene ring to which they are attached is symmetrically substituted are novel, other than the compounds where  $\text{R}^4$ ,  $\text{R}^5$ ,  $\text{R}^6$ ,  $\text{R}^7$  and  $\text{R}^{30}$  are each hydrogen, where  $\text{R}^4$  and  $\text{R}^7$  are methyl or methoxy when  $\text{R}^5$ ,  $\text{R}^6$  and  $\text{R}^{30}$  are each hydrogen, and where  $\text{R}^4$ ,  $\text{R}^7$  and  $\text{R}^{30}$  are hydrogen when  $\text{R}^5$  and  $\text{R}^6$  are each hydroxy, fluorine or chlorine. In particular, preferred intermediates of formula XVII are novel where (i)  $\text{R}^4$  and  $\text{R}^7$  are each hydrogen and  $\text{R}^5$  and  $\text{R}^6$  are either each  $\text{C}_2$ - $\text{C}_4$ -alkyl,  $\text{C}_2$ - $\text{C}_4$ -alkoxy,  $\text{C}_1$ - $\text{C}_4$ -alkoxy- $\text{C}_1$ - $\text{C}_4$ -alkyl or  $\text{R}^5$  and  $\text{R}^6$  together denote  $-(\text{CH}_2)_s-$  or  $-\text{O}(\text{CH}_2)_t\text{O}-$  where  $s$  is 1 to 4 and  $t$  is 1 or 2; or (ii)  $\text{R}^4$  and  $\text{R}^7$  are each  $\text{C}_2$ - $\text{C}_4$ -alkyl or  $\text{C}_2$ - $\text{C}_4$ -alkoxy and  $\text{R}^5$  and  $\text{R}^6$  are either each hydrogen,  $\text{C}_1$ - $\text{C}_4$ -alkyl,  $\text{C}_1$ - $\text{C}_4$ -alkoxy and  $\text{R}^5$  and  $\text{R}^6$  are either each hydrogen,  $\text{C}_1$ - $\text{C}_4$ -alkyl,  $\text{C}_1$ - $\text{C}_4$ -alkoxy, or  $\text{C}_1$ - $\text{C}_4$ -alkoxy- $\text{C}_1$ - $\text{C}_4$ -alkyl or  $\text{R}^5$  and  $\text{R}^6$  together denote  $-(\text{CH}_2)_s-$  or  $-\text{O}(\text{CH}_2)_t\text{O}-$  where  $s$  is 1 to 4 and  $t$  is 1 or 2.

Compounds of formula XVIII are novel compounds which may be prepared by reaction of a compound of formula

where Ar<sup>1</sup> is as hereinbefore defined and Hal is a halogen atom, preferably chlorine or bromine, with a compound of formula XVII as hereinbefore defined. The reaction may be carried out using conventional procedures, for example those described by Yoshizaki et al, J. Med. Chem (1976), 19(9), 1138-42.

Where desired, the protection of any reactive group may be carried out at any appropriate stage in the above processes. The protecting group is suitably one used conventionally in the art and may be introduced and removed using conventional procedure. For example, when a hydroxy group in Ar<sup>1</sup> is protected by a benzyl group, the latter may be removed by catalytic hydrogenation in the presence of palladium on charcoal using conventional procedures, such as those used hereinafter in the Examples.

Compounds of formula I in free, salt or solvate form are useful as pharmaceuticals. Accordingly the invention also provides a compound of formula I in free, salt or solvate form for use as a pharmaceutical. The compounds of formula I in free, salt or solvate form, hereinafter referred to alternatively as "agents of the invention", have good  $\beta$ 2-adrenoreceptor agonist activity. The  $\beta$ 2 agonist activity, onset of action and duration of action of the agents of the invention may be tested using the guinea pig tracheal strip in vitro assay according to the procedure of R.A. Coleman and A.T. Nials, J.Pharmacol. Methods (1989), 21(1), 71-86. The binding potency and selectivity for the  $\beta$ 2-adrenoreceptor relative to the  $\beta$ 1-adrenoreceptor can be measured by a classical filtration binding assay according to the procedure of Current Protocols in Pharmacology (S.J.Enna(editor-in-chief) et al, John Wiley & Son, Inc, 1998), or by cAMP determination in cells expressing  $\beta$ 2- or  $\beta$ 1-adrenoceptor, according to the procedure of B. January et al, British J. Pharmacol. 123: 701-711 (1998).

*Revised B1* The agents of the invention commonly have a rapid onset of action and have a prolonged stimulating action on the  $\beta$ 2-adrenoreceptor, compounds of the Examples hereinbelow having K<sub>i</sub> ( $\beta$ 2) values of the order of 0.1 to 1000 nM, having durations of action of the

B1  
cont

order of 1 to greater than 12 hours, and having binding selectivities for the  $\beta_2$ -adrenoreceptor relative to the  $\beta_1$ -adrenoreceptor from 1.5 to 500. For example, the compounds of Examples 1, 2, 4, 5, 6, 8, 27 and 29 have  $\beta_2$  and  $\beta_1$  binding potencies, measured by cAMP determination in cells expressing  $\beta_2$ - and  $\beta_1$ - adrenoreceptors, represented by  $EC_{50}$  values ( $\beta_2/\beta_1$ ) (in nM) of 0.92/9.52, 0.23/1.25, 6.07/14.5, 0.79/6.10, 0.3/3.60, 0.57/8.46 and 0.012/0.5 respectively. The compounds of Examples 2, 4, 5, 27 and 29 have T(50%) times (in minutes) of  $\geq 400$  at 71nM concentration, 82 at 100 nM, 444 at 100nM, 222 at 1.0nM and 279 at 10nM respectively in the guinea pig tracheal strip assay, where T(50%) is the time for inhibition of contraction to decay to 50% of its maximum value.

Having regard to their  $\beta_2$  agonist activity, the agents of the invention are suitable for use in the treatment of any condition which is prevented or alleviated by activation of the  $\beta_2$ -adrenoreceptor. In view of their long acting selective  $\beta_2$  agonist activity, the agents of the invention are useful in the relaxation of bronchial smooth muscle and the relief of bronchoconstriction. Relief of bronchoconstriction can be measured in models such as the in vivo plethysmography models of Chong et al, J. Pharmacol.Toxicol. Methods 1998, 39, 163-168, Hammelmann et al, Am. J. Respir. Crit. Care Med., 1997, 156, 766-775 and analogous models. The agents of the invention are therefore useful in the treatment of obstructive or inflammatory airways diseases. In view of their long duration of action, it is possible to administer the agents of the invention once-a-day in the treatment of such diseases. In another aspect, agents of the invention commonly exhibit characteristics indicating a low incidence of side effects commonly encountered with  $\beta_2$  agonists such as tachycardia, tremor and restlessness, such agents accordingly being suitable for use in on demand (rescue) treatment as well as prophylactic treatment of obstructive or inflammatory airways diseases.

Treatment of a disease in accordance with the invention may be symptomatic or prophylactic treatment. Inflammatory or obstructive airways diseases to which the present invention is applicable include asthma of whatever type or genesis including both intrinsic (non-allergic) asthma and extrinsic (allergic) asthma. Treatment of asthma is also to be understood as embracing treatment of subjects, e.g. of less than 4 or 5 years of age, exhibiting wheezing symptoms and diagnosed or diagnosable as "wheezy infants", an established patient category of major medical concern and now often identified as incipient

or early-phase asthmatics. (For convenience this particular asthmatic condition is referred to as "wheezy-infant syndrome".)

Prophylactic efficacy in the treatment of asthma will be evidenced by reduced frequency or severity of symptomatic attack, e.g. of acute asthmatic or bronchoconstrictor attack, improvement in lung function or improved airways hyperreactivity. It may further be evidenced by reduced requirement for other, symptomatic therapy, i.e. therapy for or intended to restrict or abort symptomatic attack when it occurs, for example anti-inflammatory (e.g. corticosteroid) or bronchodilatory. Prophylactic benefit in asthma may in particular be apparent in subjects prone to "morning dipping". "Morning dipping" is a recognised asthmatic syndrome, common to a substantial percentage of asthmatics and characterised by asthma attack, e.g. between the hours of about 4 to 6 am, i.e. at a time normally substantially distant from any previously administered symptomatic asthma therapy.

Other inflammatory or obstructive airways diseases and conditions to which the present invention is applicable include adult respiratory distress syndrome (ARDS), chronic obstructive pulmonary or airways disease (COPD or COAD), including chronic bronchitis, or dyspnea associated therewith, emphysema, as well as exacerbation of airways hyperreactivity consequent to other drug therapy, in particular other inhaled drug therapy. The invention is also applicable to the treatment of bronchitis of whatever type or genesis including, e.g., acute, arachidic, catarrhal, croupus, chronic or phthinoïd bronchitis. Further inflammatory or obstructive airways diseases to which the present invention is applicable include pneumoconiosis (an inflammatory, commonly occupational, disease of the lungs, frequently accompanied by airways obstruction, whether chronic or acute, and occasioned by repeated inhalation of dusts) of whatever type or genesis, including, for example, aluminosis, anthracosis, asbestosis, chalicosis, ptilosis, siderosis, silicosis, tabacosis and byssinosis.

Having regard to their  $\beta_2$  agonist activity, the agents of the invention are also useful in the treatment of a condition requiring relaxation of smooth muscle of the uterus or vascular system. They are thus useful for the prevention or alleviation of premature labour pains in pregnancy. They are also useful in the treatment of chronic and acute urticaria, psoriasis, allergic conjunctivitis, actinitis, hay fever, and mastocytosis.

100090000-010000

The agents of the invention are also useful as co-therapeutic agents for use in conjunction with anti-inflammatory or bronchodilatory drug substances, particularly in the treatment of obstructive or inflammatory airways diseases such as those mentioned hereinbefore, for example as potentiators of therapeutic activity of such drugs or as a means of reducing required dosaging or potential side effects of such drugs. An agent of the invention may be mixed with the anti-inflammatory or bronchodilatory drug in a fixed pharmaceutical composition or it may be administered separately, before, simultaneously with or after the anti-inflammatory or bronchodilatory drug. Such anti-inflammatory drugs include steroids, in particular glucocorticosteroids such as budesonide, beclamethasone, fluticasone or mometasone, and dopamine receptor agonists such as cabergoline, bromocriptine or ropinirole. Such bronchodilatory drugs include anticholinergic or antimuscarinic agents, in particular ipratropium bromide, oxitropium bromide and tiotropium bromide. Combinations of agents of the invention and steroids may be used, for example, in the treatment of COPD or, particularly, asthma. Combinations of agents of the invention and anticholinergic or antimuscarinic agents or dopamine receptor agonists may be used, for example, in the treatment of asthma or, particularly, COPD.

In accordance with the foregoing, the present invention also provides a method for the treatment of an obstructive or inflammatory airways disease which comprises administering to a subject, particularly a human subject, in need thereof a compound of formula I, or a pharmaceutically acceptable salt or solvate thereof, as hereinbefore described. In another aspect, the invention provides a compound of formula I, or a pharmaceutically acceptable salt or solvate thereof, as hereinbefore described for use in the preparation of a medicament for the treatment of an obstructive or inflammatory airways disease.

The agents of the invention may be administered by any appropriate route, e.g. orally, for example in the form of a tablet or capsule; parenterally, for example intravenously; topically to the skin, for example in the treatment of psoriasis; intranasally, for example in the treatment of hay fever; or, preferably, by inhalation, particularly in the treatment of obstructive or inflammatory airways diseases.

In a further aspect, the invention also provides a pharmaceutical composition comprising a compound of formula I in free form or in the form of a pharmaceutically acceptable salt or solvate thereof, optionally together with a pharmaceutically acceptable diluent or carrier therefor. Such compositions may be prepared using conventional diluents or excipients and techniques known in the galenic art. Thus oral dosage forms may include tablets and

capsules. Formulations for topical administration may take the form of creams, ointments, gels or transdermal delivery systems, e.g. patches. Compositions for inhalation may comprise aerosol or other atomizable formulations or dry powder formulations.

The invention also includes (A) a compound of formula I as hereinbefore described in free form, or a pharmaceutically acceptable salt or solvate thereof, in inhalable form; (B) an inhalable medicament comprising such a compound in inhalable form together with a pharmaceutically acceptable carrier in inhalable form; (C) a pharmaceutical product comprising such a compound in inhalable form in association with an inhalation device; and (D) an inhalation device containing such a compound in inhalable form.

Dosages employed in practising the invention will of course vary depending, for example, on the particular condition to be treated, the effect desired and the mode of administration. In general, suitable daily dosages for administration by inhalation are of the order of from 1 to 5000µg.

The invention is illustrated by the following Examples. Compounds used in the Examples are prepared as follows:

#### Intermediate 1 - 5,6-Diethyl-inden-2-ylamine hydrochloride

##### Preparation 1 - 3-chloro-1-(3,4-diethylphenyl)- 1-propanone

1,2-Diethylbenzene (10.9 g, 74.6 mmol) and propionyl chloride (9.7 g, 74.6 mmol) are added dropwise to AlCl<sub>3</sub> (22.3 g, 167.8 mmol) in nitromethane (75 mL) over 30 min. The reaction mixture is stirred at room temperature for 2 hours, after which 70 g of ice and 14 mL concentrated sulphuric acid are added. The aqueous phase is extracted with ether, and the combined organic phases extracted with 2N HCl and saturated aqueous NaCl.
